Codeware E-commerce Platform — Client Overview

Oct 14, 2026 · @Md Abu Taher

Codeware is a ready-to-run online shop with its own admin panel: your customers browse, order and track purchases on the website, and your team manages products, orders, stock, offers and content from one dashboard.

Overview

- **Storefront (E-commerce theme):** the public shop with product catalogue, search, cart, checkout and customer accounts.
- **Admin panel:** one place to manage products, orders, customers, discounts, shipping, payments, content and settings.
- **Extra portals:** a separate Vendor portal for sellers and a Delivery portal for delivery staff, each with its own login.
- **Flexible by design:** modules can be switched on or off, the look can be changed through themes, and the site works in English and Bangla.
- **API included:** a REST API lets a mobile app or another website use the same products and orders.

E-commerce storefront (what customers see)

The E-commerce theme gives customers a complete shopping journey from first visit to delivered order.

Browsing and finding products

- **Home page** with banners, featured products and promo blocks that the admin can change without code.
- **Shop page** listing all products, plus pages by **category**, **brand** and **tag**.
- **Live header search** so customers find a product while typing.
- **Product page** with image gallery, price and sale price, description, specifications, variations (for example size or colour), FAQs, related products, warranty period and customer reviews.
- **Flash Deals page** showing time-limited sales with a countdown.
- **Favorites (wishlist):** guests can save products too, and the list merges into their account when they sign in.

- **Blog** with posts, comments and likes, to bring visitors in through content.

Cart and checkout

- **Cart** that updates instantly, with a live item count in the header.
- **Checkout** where the customer enters name, email, phone and address and picks a **shipping method** and **payment method**.
- **Coupon codes** and optional **VAT** are calculated automatically in the total.
- **Order confirmation page** with the order number, and a confirmation email.
- Guests can order without an account; signed-in customers have their details filled in.

Customer account

- Dashboard with a summary of the customer's activity.
- **Order history** and a detail page per order showing its current status.
- Profile editing, login, registration, email verification code and password reset.

Order and payment flow

Order status	Meaning
Pending	Order received, not yet handled
Processing	Being prepared
Shipped	Handed to delivery
Delivered	Received by the customer
Cancelled	Order cancelled

Payment status is tracked separately: Pending, Paid, Failed or Refunded.

Payment methods: Cash on Delivery works end to end today. PayPal, Stripe, bKash, SSLCommerz, Apple Pay and Google Pay can be enabled from the admin and selected at checkout, but their live payment connection is not built yet, so orders paid this way stay pending until the integration is added. This is the main item to confirm with the client.

Admin panel (how you run the shop)

The admin panel runs on its own address with its own login, separate from the customer site. A sidebar groups every module, and a dashboard shows totals for products, categories, posts, pages and media, plus what was added this month.

Products and catalogue

Module	What you can do
Products	Add physical or digital products with name, SKU, price, sale price, stock quantity, images and gallery (drag to reorder), description, specifications, FAQs, related products, warranty months, featured flag and Bangla/English text
Variations	Define attributes (size, colour) and auto-generate every combination with its own SKU, price and stock
Categories, Tags, Brands	Organise the catalogue; categories can be nested
Product Attributes	Reusable options such as size or colour
Vendors	Sellers whose products appear in the shop
Import and export	Download product, category, brand, tag and other lists as files; print product labels
Page builder	Visual editor to design a product's page layout

Orders and customers

- **Orders list** with filters by status, payment status, payment method and date.
- **Order detail:** change order status and payment status, assign a **delivery person**, and print or download the **invoice**, **address label** and **warranty certificate**.
- **Reports** with the same filters, exportable to a file.
- **Users, Roles and Permissions:** create staff accounts and decide exactly what each role can see or change. Accounts can be blocked.
- **Reviews and Comments:** approve or remove what customers post.
- **Contacts, Newsletter subscribers, Bookings:** messages and sign-ups from the website.

Sales tools

Module	Purpose
Coupons	Percentage or fixed amount, minimum order, usage limit, expiry date, restricted to chosen products

Module	Purpose
Discounts	Price reductions on chosen products for a date range
Flash Deals	Time-boxed sales with a countdown page on the storefront
Gift Vouchers	Sell vouchers; each purchase is recorded and delivered as a PDF
Shipping Methods	Delivery options with their cost, shown at checkout
Payment Gateways	Switch payment methods on or off
Advertisements	Banner beside the product description, with click counting
Location	Country, division, district and upazila lists used for addresses

Content and appearance

- **Pages** and **CMS sections** (titles, text, buttons, cards, images) for About, Contact and FAQ.
- **Blog posts** with categories and tags.
- **Media Library** and **File Manager** for images and files; large files upload in chunks.
- **Menu manager** to build the header and footer menus.
- **Theme Settings:** choose the active theme, colours, fonts, logo and homepage content.
- **SEO**, **Sitemap**, **robots.txt** and **Social links**.
- **Email templates** for order and account emails.

System and security

- **Settings:** general site, VAT, language switcher and environment options.
- **Features:** switch whole modules on or off per site; hidden modules disappear from the menu and are blocked.
- **Languages and Translations:** English and Bangla, editable from the panel.
- **Activity history:** a log of what each admin did.
- **Two-step login (MFA):** can be required for admins, with passkey support.
- **Backup**, **password generator**, **built-in chat** between users, **notifications** and a **developer guide**.

Role-based access

- **Admin and Staff:** Staff can manage products, orders and content; system screens (Settings, Users, Coupons, Payments and similar) are for Admin only.
- **Vendor portal:** a seller logs in separately to manage their own products and see their orders and invoices.
- **Delivery portal:** delivery staff log in separately and see only the orders assigned to them.

Themes, plugins, languages and API

- **Themes:** the site's look is a swappable theme. This project ships an E-commerce theme (the main one), a Portfolio theme and a default theme. A theme can be downloaded as a zip, installed, or deleted from Theme Settings, and each theme keeps its own colours and settings.
- **Plugins:** small add-ons installed from Plugin Settings. Two come included: a Calendar and a Clock for the admin header.
- **Languages:** every product, page and post can hold English and Bangla text, and customers can switch language on the site.
- **REST API:** public endpoints (products, categories, posts, pages, flash deals, cart, orders, reviews, vouchers, settings) and protected admin endpoints, so a mobile app can be built on the same data.

Technology and security

- **Built with:** Laravel (PHP) for the backend, Livewire and Flux UI for the admin, Tailwind CSS for styling.
- **Security:** separate logins for admin, vendor and delivery; role-based permissions; optional two-step login and passkeys; blocked accounts; an activity log of admin actions; reCAPTCHA support.
- **Speed:** frequently used settings and dashboard numbers are cached.
- **Not finished yet:** online payment gateways other than Cash on Delivery need their live integration before accepting card or wallet payments.
